

Project 2 – Basic Implementation Phase Contribution Report

- Summary of work Completed in Phase:
 - Marshall: Items.hpp, Items.cpp, Player.hpp, Player.cpp, GameEnvironment.hpp, GameEnvironment.cpp, Command.hpp, Command.cpp
 - Ivana: Basic skeleton, Command.hpp, Command.cpp, GameEnvironment.hpp, GameEnvironment.cpp, Help.hpp, Help.cpp, updated UML.
 - Christian: NPC.hpp, NPC.cpp, UML.
- Design Changes made:
 - Removed the vector of items for each phase as they did not do much when we reset items and created new ones for each phase.
 - Completely changed how NPC talked to make it easier to add NPCs to our rooms.
 - Added a struct to the game environment for rooms to make it more concise and easy to add rooms with multiple exits, items, and npcs.
 - Command has functions to manipulate the input to make it simple for our functions to handle.
- Reflections on Team Workflow
 - Since everybody was out of town for reading week, Marshall did most of the important functions over the break, and after the break the team got together to brainstorm how to implement the remaining functions, adding utility to the already existing functions, and how we want to proceed.
- Lessons Learned During This Implementation Phase
 - Being able to coordinate and work on things with other people at the same time is difficult, especially when functions rely on other ones to work.
